

Keller Mitigation Site

We are proposing to rehabilitate wetlands at the Keller Mitigation Site in Redmond in order to achieve no net loss of wetland functions. The final design of the mitigation site will be sufficient to meet local, state and federal requirements.

The proposed mitigation site will be monitored for up to 10 years. Monitoring, contingency, and site management plans will be provided and used to adaptively manage the mitigation site.

The design for the Keller Mitigation Site will likely incorporate the following items:

- Rehabilitate approximately 30 acres
- Create new channels
- Install large woody debris
- Block drain tiles
- Fill drain ditches
- Create vertical and horizontal habitat diversity

Activities for buffer areas will include replanting with appropriate native plants and controlling invasive species.
